

Sorting

T#12

Sorting

- **Sorting takes an unordered collection and makes it an ordered one.**

Selection Sort

- Idea:
 - Find the smallest element in the array
 - Exchange it with the element in the first position
 - Find the second smallest element and exchange it with the element in the second position
 - Continue until the array is sorted
- Disadvantage:
 - Running time depends only slightly on the amount of order in the file

Example

8	4	6	9	2	3	1
---	---	---	---	---	---	---

1	4	6	9	2	3	8
---	---	---	---	---	---	---

1	2	6	9	4	3	8
---	---	---	---	---	---	---

1	2	3	9	4	6	8
---	---	---	---	---	---	---

1	2	3	4	9	6	8
---	---	---	---	---	---	---

1	2	3	4	6	9	8
---	---	---	---	---	---	---

1	2	3	4	6	8	9
---	---	---	---	---	---	---

1	2	3	4	6	8	9
---	---	---	---	---	---	---

Selection Sort

```
void Selection Sort(int[] A)
  for  $i$  from 0 to  $n - 2$  do
     $min = i$ 
    for  $j$  from  $i + 1$  to  $n - 1$  do
      if  $A[j] < A[min]$  then
         $min = j$ 
      end if
    end for
    {Swap  $A[i]$  and  $A[min]$ }
     $tmp = A[i]$ 
     $A[i] = A[min]$ 
     $A[min] = tmp$ 
  end for
```

Insertion Sort

- Idea: like sorting a hand of playing cards
 - Start with an empty left hand and the cards facing down on the table.
 - Remove one card at a time from the table, and insert it into the correct position in the left hand
 - compare it with each of the cards already in the hand, from right to left
 - The cards held in the left hand are sorted
 - these cards were originally the top cards of the pile on the table

Insertion Sort

```
void Insertion Sort(int [] A)
  for  $i$  from 1 to  $n - 1$  do
     $j = i$ 
    while ( $j > 0$ ) and ( $A[j] < A[j - 1]$ ) do
      {Swap  $A[j - 1]$  and  $A[j]$ }
       $tmp = A[j]$ 
       $A[j] = A[j - 1]$ 
       $A[j - 1] = tmp$ 
       $j = j - 1$ 
    end while
  end for
```

Insertion Sort

Bubble Sort

- Idea:
 - Repeatedly pass through the array
 - Swaps adjacent elements that are out of order

Bubble Sort

```
void Bubble Sort(int [] A)
  for  $i$  from 0 to  $n - 1$  do
    for  $j$  from  $n - 2$  down to  $i$  do
      if  $A[j] > A[j + 1]$  then
        {Swap  $A[j]$  and  $A[j + 1]$ }
         $tmp = A[j]$ 
         $A[j] = A[j + 1]$ 
         $A[j + 1] = tmp$ 
      end if
    end for
  end for
```

```

void Bubble Sort(int [] A)
  for  $i$  from 0 to  $n - 1$  do
    for  $j$  from  $n - 2$  down to  $i$  do
      if  $A[j] > A[j + 1]$  then
        {Swap  $A[j]$  and  $A[j + 1]$ }
         $tmp = A[j]$ 
         $A[j] = A[j + 1]$ 
         $A[j + 1] = tmp$ 
      end if
    end for
  end for

```

$$T(n) = c_1(n+1) + c_2 \sum_{i=0}^{n-1} (n-i) + c_3 \sum_{i=0}^{n-1} (n-i-1) + c_4 \sum_{i=0}^{n-1} (n-i-1)$$

Thus, $T(n) = \Theta(n^2)$

Example

8	4	6	9	2	3	1
---	---	---	---	---	---	---

$i = 0$ ←----- j

8	4	6	9	2	1	3
---	---	---	---	---	---	---

$i = 0$ ←----- j

8	4	6	9	1	2	3
---	---	---	---	---	---	---

$i = 0$ ←----- j

8	4	6	1	9	2	3
---	---	---	---	---	---	---

$i = 0$ ←-- j

8	4	1	6	9	2	3
---	---	---	---	---	---	---

$i = 0$ j

8	1	4	6	9	2	3
---	---	---	---	---	---	---

$i = 0$ j

1	8	4	6	9	2	3
---	---	---	---	---	---	---

$i = 0$ j

1	8	4	6	9	2	3
---	---	---	---	---	---	---

$i = 1$ j

1	2	8	4	6	9	3
---	---	---	---	---	---	---

$i = 2$ j

1	2	3	8	4	6	9
---	---	---	---	---	---	---

$i = 3$ j

1	2	3	4	8	6	9
---	---	---	---	---	---	---

$i = 4$ j

1	2	3	4	6	8	9
---	---	---	---	---	---	---

$i = 5$ j

1	2	3	4	6	8	9
---	---	---	---	---	---	---

$i = 6$

j

Repeat “Bubble Up” How Many Times?

- If we have N elements...
- And if each time we bubble an element, we place it in its correct location...
- Then we repeat the “bubble up” process $N - 1$ times.
- This guarantees we’ll correctly place all N elements.

Compare these two bubble sort solutions

A

```
void Bubble Sort(int [] A)
  for i from 0 to  $n - 1$  do
    for j from  $n - 2$  down to i do
      if  $A[j] > A[j + 1]$  then
        {Swap  $A[j]$  and  $A[j + 1]$ }
        tmp =  $A[j]$ 
         $A[j] = A[j + 1]$ 
         $A[j + 1] = tmp$ 
      end if
    end for
  end for
```

B

```
exchanges = true;
while (exchanges) {
  exchanges = false;
  i = 0;
  while (i < A.length-1) {
    if ( $A[i] > A[i+1]$ ) {
      Swap  $A[i]$  and  $A[i+1]$ 
      exchanges = true;
    }
    i = i+1;
  }
}
```

Reducing the Number of Comparisons

- On the N^{th} iteration, we only need to do **MAX-N comparisons.**

Already Sorted Collections?

- **What if the collection was already sorted?**
- **What if only a few elements were out of place and after a couple of “bubble ups,” the collection was sorted?**
- **We want to be able to detect this and “stop early”!**

Using a Boolean “Flag”

- **We can use a boolean variable to determine if any swapping occurred during the inner loop.**
- **If no swapping occurred, then we know that the collection is already sorted!**
- **This boolean “flag” needs to be reset after each inner loop.**

Bubble Sort Loop Invariant (inner Loop)

```
void Bubble Sort(int [] A)
  for  $i$  from 0 to  $n - 1$  do
    for  $j$  from  $n - 2$  down to  $i$  do
      if  $A[j] > A[j + 1]$  then
        {Swap  $A[j]$  and  $A[j + 1]$ }
         $tmp = A[j]$ 
         $A[j] = A[j + 1]$ 
         $A[j + 1] = tmp$ 
      end if
    end for
  end for
```

Each time we put the smallest elements at the beginning, and once we put them there, we don't move them again

- The variable i starts at the first index in the array and increases to $n-1$
- Our invariant is: Every element to the left of i is in the correct place
- That is, for all $h < i$, if $h < k$, then $a[h] \leq a[k]$
- When this is combined with the loop exit test, $i == n-1$, we know that *all* elements of the array are in the correct place
